No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New peptide antagonist of zonulin useful as antiinflammatory agent for

WPI; 2000-205565/18

ema, gastritis, encephalomyelitis -

```
CC (Z), one of 25 such peptides (see Y9105-29) of the invention, which bind to a zonula occludents toxin (20T) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (YJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor (Z). They can be prepared by chemical synthesis or by use of thinding. They can be prepared by chemical synthesis or by use of creambinant DNA techniques. The peptide antagonists are used as an artiinflammatory agents in the treatment of gastrointestinal confinement on the zor receptor in the intestine can yet does not physiologically modulate the opening of Ty in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridum difficile increases with cause diseases with meccaused by infection, e.g. Clostridum difficile infection, consecution, e.g. consential proteins of the cancer, collagenous colitis, inflammatory bowel disease, diseases with mucosal diseases without unceration, e.g. astroitestial lymphanglectasia, correction of congenital heart disease with Fontan's operation, correction of congenital heart disease with Fontan's operation, collagenous colours expenditum disease, and after surgical correction of congenital heart disease with Fontan's operation, collagenous colours and consenses with sease, costnophilic gastroenteritis, and after surgical correction of congenital heart disease with Fontan's operation, collagenous colours and consenses with sease, costnophilic gastroenteritis, and immune diseases, coellag disease, ecsnophilic gastroenteritis, and immune diseases, coellag classes, ecsnophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This present sequence is that of a peptide antagonist of zonulin (27), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (C (73). The peptide antagonists are based on a common motif of 207 and human zonulins, which is believed to be critical for receptor and human zonulins. The peptide antagonists are used as an inflammanton, where they bind to the 207 receptor in the intestine criminatory agents in the treatment of gastrointestinal criminatory agents in the treatment of gastrointestinal conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. clostridium difficile infection, contestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by Imphantic obstruction, e.g. congenital infestinal lymphanglectasia, correction of congenital heart disease with Fontar's operation, correction of congenital heart disease with Fontar's operation, collage disease, eosinophilic gastrocenteritis, and immune diseases, collage, eosinophilic gastrocenteritis, and immune diseases, collage, eosinophilic gastrocenteritis, and immune diseases, collage, eosinophilic gastrocenteritis, primarily to milk, e.g. systemic lupus erythematosus or food allergies, primarily to

The peptide antagonists are based on a common motif of 207 CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the 207 receptor in the intestine and yet does not physiologically modulate the opening of TJ in the CC increased intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, confection, e.g. clostridium difficile infection, collitis, wiral gastroenteritis, parasite CC infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations, e.g. spatralitis, parasite collagenous colitis, inflammatory bowel disease, diseases marked by CC lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, colliderial party by the colliderial

Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shighlosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastricts, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosiophilic gastroenteritis, and immune diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the

This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludent toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TV). The peptide antagonists are based on a common motif of zor and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammation, where they bind to the ZOT receptor in the intestine antiyoty agents in the treatment of gastrointestinal corresponding to the string the opening of TV in the intestine for the string the string the peptide is useful for the intestine for the string intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide infection, e.g. Clostridium difficile infection, bacterial overgrowth, whipple's disease, with concessed by infection, e.g. Clostridium difficile infection, bacterial overgrowth, whipple's diseases marked by impartation, bacterial overgrowth, whipple's diseases marked by impartation obstruction, e.g. congenital intestinal lymphangisectasia, correction of congenital heart disease, with force are constant of congenital heart diseases with force are constant diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, coeliac disease, eosinophilic gastroenteritis, and immune diseases, coeliac disease, eosinophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 80.5%;

                                                                                                                                                                                                                                                                                                                                                                                                    χχ
                                                                                                                                                                                                                                                                                                                                                                                                                                                          This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y9105-29) of the invention. CC which bind to a zonula occludens toxin (207) receptor, yet do not compliant to a zonula occludens toxin (207) receptor, yet do not compliant productions compliant to the control of the peptide antagonists are based on a common motif of 207 and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinfiammation, where they bind to the ZOT receptor in the intestinal inflammation where they bind to the ZOT receptor in the intestinal conditions that cause poeting of TJ in the intestine. Gastrointestinal inflammation conditions give rise to intestine. Gastrointestinal inflammation conditions give rise to cincreased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, cancer, collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, inflammatory bowel disease, diseases marked by imphatic obstruction, e.g. congenital intestinal lymphangiactasia, correction of congenital heart disease with Fontan's operation, collagenous colitis, inflammatory solutions, and after surgical correction of congenital heart disease with Fontan's operation, collagenous colitis, inflammatory solutions, and after surgical consideration, beginned the seases, elseases, eschophilic gastroenteritis, and immune diseases, eschophilic gastroenteritis, and immune diseases, eschophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                Query Match 80.

The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zonulin; antagonist; zonula occludens toxin receptor; blood-brain barrier; antiinflammatory; cerebroprotective; neuroprotective; dermatological; antiulcer; antiviral; antibacterial; cytostatic; anti-HIV; vulnerary; antiallergic; hypotensive; immunosuppressive; antiparasitic; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigeilosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gastrointestinal inflammation;
                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a human guanylin preprohormone which is cleaved to generate a 15 amino acid mature peptide (Y4245B). Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotoxins which activate intestinal guanylate cyclases. The guanylate can be used as a laxative in the treatment of constipation.

cc amino acid residue within the region corresponding to the AB loop or FG loop of the wild type adenovirus (Ad) 5 fibre protein, and where the recombinant fibre protein trimerises when corresponding to residue postting at least one amino acid residue to residue postting at least one amino acid residue (Ad) 5 fibre protein trimerises when corresponding to residue postting at least one amino acid residue (Ad) 442,449-454, 458 460,462,465,467,468,409,412-417,482,485,467,492,505-512,515,517,519,521-528,533,535,537-549,551,533,555,559-568,580 or 581 of the wild-type Ad5 fibre protein, and where ccll. (I) are used for creating vectors which are useful in a variety of gene-transfer applications, in vitro and in vivo, for delivering a desired gene to a cell with minimal ectopic infection, an approach known as alternative targeting. (I) can be used in receptor-ligand sasays and as adhesion proteins in vitro or in vivo. The recombinant cc fibre protein permits more efficient production and construction of safer vectors for gene-transfer applications. The present sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                 Chimaeric adenovirus; gene therapy; antigenicity; fiber protein; serotype 9; penton protein; hexon protein.
                                                                                                                                                                                                                                                                                                                                                                                                                 Amino acid sequence of the fiber protein of Adenovirus serotype 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a recombinant fibre protein (1) comprising an amino terminus of an adenoviral fibre protein and a trimerisation domain. The trimerisation domain comprises; (a) an adenoviral fibre knob domain having a mutation affecting at least one adenoviral fibre knob domain having a mutation affecting at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 45-46; 69pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC v68642-70 represent the amino acid sequences of the fiber proteins CC of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, CC 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and 51. CC The proteins are used in the course of the invention to construct CC chimaeric adenoviruses with reduced antigenicity. The chimaeric CC adenoviruses comprise at least part of a fiber protein of an adenovirus serotype providing the chimaeric virus with a desired host range and at CC least part of a penton or hexon protein from another, less antigenic, CC serotype. The chimaeric adenoviruses are useful for gene therapy, CC especially where repeated delivery is required. Adenoviruses of the CC invention are useful can be constructed to have a desired host range and CC adminished capability to raise neutralizing antibodies, an absence of, CC or decreased infection of, antigen presenting cells of the immune system CC (e.g. macrophages), and an ability to escape trapping in the liver very
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, 23, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and 51. The proteins are used in the course of the invention to construct chimaeric adenoviruses with reduced antigenicity. The chimaeric adenoviruses comprise at least part of a fiber protein of an adenovirus serotype providing the chimaeric virus with a desired host range and at 1 least part of a penton or hexon protein from another, less antigenic, 20 serotype. The chimaeric adenoviruses are useful for gene therapy, 21 cespecially where repeated delivery is required. Adenoviruses of the 22 invention are useful can be constructed to have a desired host range and 22 a diminished capability to raise neutralizing antibodies, an absence of, 22 cor decreased infection of, antigen presenting cells of the immune system 22 cells and an ability to escape trapping in the liver 23 cells of the immune system 24 through increased target cell specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The chimaeric adenoviruses are useful for gene therapy, invention are iseful can be constructed to have a desired host range and decreased infection of, antigen presenting antibodies, an absence of, e.g. macrophages), and an ability to escape trapping in the liver through increased target cell specificity.

A05803 to A05872 encode proteins, polypeptides and peptides (given in Y91275 to Y91343) isolated from Group B Streptococcus (GBS), also known as Streptococcus agglactiae. The GBS polynucleotides and polypeptides have antibacterial activity. Immunogenic compositions comprising GBS polynucleotides or polypeptides can be used as vaccines and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a secreted human protein encoded by the gene CC clone detailed in the descriptor line. The gene can be used to generate portion (e.g., X84924) for increasing the stability of the fused protein Fc as compared to the human protein only.

CC as compared to the human protein only.

CC are useful for preventing, treating or ameliorating medical conditions can be greated to gene therapy. Also, pathological conditions can be greated and the presence of mutations in the new polypeptides in a sample which cuses are described for each of the 125 polynucleotides, based on uses).

Length 530

purf bifunctional enzyme - Haemophilus influenzae (strain Rd KW20)

R/Contains: IMP cyclohydrolase (EC 3.5.4.10); phosphoribosylaminoimidazolecarboxamide

C/Species: Reamophilus influenzae

C/Date: Reamophilus influenzae

RESULT 15
5-methyltetrahydropteroyltriglutamate--homocysteine S-methyltransferase (EC 2.1.1.14) -
N.Alternate names: cobalamin-independent methionine synthase
C;Species: Methanobacterium thermosutotrophicum
C;Oate: 28-Oct-1996 #sequence_revision 13-Mar-1997 #text_change 20-Jun-2000
C;Accession: $62191
R;Vaupel, M.; Dietz, H.; Linder, D.; Thauer, R.K.
Eur. J. Blochem. 236, 294-300, 1996
A;Title: Primary structure of cyclohydrolase (Mch) from Methanobacterium thermoautotroph
A;Reference number: $62190; MUID:96184910
A;Resioues: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Resioues: 1-319 <VAUJ
A;Cross-references: EMBL:x92082; NID:g1103706; PIDN:CAA63062.1; PID:g1103707
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, October 1995
C;Genetics:
A;Start codon: TTG
C:Superfamily: 5-methyltetrahydropteroyltriglutamate--homocysteine S-methyltransferase
C;Keywords: methyltransferase

::
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B B

BIOCHEMISTY 3::13581-13592(1994).

FINCTION: ENDOCENOUS ACTIVATOR OF INTESTINAL GUANYLATE CYCLASE.

TI STUMLATES THIS ENZYME THROUGH THE SAME RECEPTOR BINDING REGION AS THE HEAT-STABLE ENTEROTOXINS.

ITISSUE SPECIFICITY: HIGHLY EXPRESSED IN ILEUM AND COLON.

STABLE ENTEROTOXINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRUCTURE BY NMR OF 101-115.

RY "Comparing the predicted and observed properties of proteins encoded ReT in the genome of Escherichia coli K-12.";

RI Electrophoresis 18:1259-1313(1997).

CC - FUNCTION: IT FUNCTIONS IN THE CONVERSION OF NUCLEOSIDES, AND IN NUCLEOSIDE DERIVATIVES OF G TO A NUCLEOTIDES, AND IN ALINEARING THE INVERCELLULAR BALANCE OF A AND G. NUCLEOTIDES.

CC MALIVAL ACTIVITY: NADPH + GUANOSINE 5'-PHOSPHATE - NADP(+) + CC - INDSINE 5'-PHOSPHATE + WH(3).

CC - SUBUNIT: HOMOTETRAWER.

CC - SIMILARITY: TO OTHER EUKARYOTIC AND PROKARYOTIC GMP REDUCTASE CC AND TO IMP DEHYDROGENASE.

THE FOUR PROTEINS FIXA, FIXH AND FIXS MAY PARTICIPATE IN A MEMBRANE-BOUND COMPLEX COUPLING THE FIXI CATION PUMP WITH A REDOX PROCESS CATALYZED BY FIXG.

-!- CATALYTIC ACTIVITY: ATP + H(2)O = ADP + ORTHOPHOSPHATE.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFRANILY IB.

Result

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
